Allergies when Utilising MIMS Integration

As part of installing MIMS, a series of 'MIMS Allergy classes' are created (**Administration>Patients>Alerts and Allergies>MIMS**). Any existing allergies exist for patients these would need to be re-classified under these categories for proper auto-checking.

The screenshot shows the CareRight software interface. On the left is a navigation menu with options like Dashboard, Administration, Patients, Alert Definitions, Clinical Note Categories, Custom Patient Fields, Custom Patient Labels, Diagnosis & History Groups, Diagnosis Codes, Image Categories, Patient Settings, Person Fields, and Problem Codes. The main area is titled 'Alert Definitions' and has tabs for ALERT, ALLERGY, NOTICE, and MIMS. Below the tabs is a breadcrumb trail: Dashboard / Administration / Patients. A search bar is present. The main content is a table with columns: Code, Alert Type, Description, and Ending. The table lists several allergy entries with their respective codes and descriptions, each with a 'Show' button to its right.

Code	Alert Type	Description	Ending
8258	Allergy	10-hydroxydecanoic acid	Show
7121	Allergy	10-hydroxydecanoic acid	Show
7348	Allergy	1,1,2,2,3,3,3a,4,4,5,5,6,6,7,7,7a-hexadecafluorooctahydroinden	Show
2886	Allergy	1,2-hexanediol	Show
7349	Allergy	1,3 distearyl hydrogen citrate	Show

Steps add an Allergen

1. **Dashboard**
2. Open Patient
3. **Alerts and Allergies**
4. Click **New** in the Allergies section
5. Search for an allergy in the dropdown. This will display MIMS and non-MIMS allergy.

Important note:

- If a patient has an active/existing non-MIMS allergy, when raising a MIMS prescription a warning message is displayed, advising that "Patient has 1 allergy that is not linked to MIMS Allergies. Manual drug checking is required."
- If a patient has a MIMS allergy, and a drug is added to a MIMS prescription with that allergen, then a message like the following appears:
 - Allergy Warning Patient may be allergic to the prescribing item, BenPen Powder for injection (Powder for injection) 600 mg (solv. req'd) [1].
 - Allergy history: The patient has a known history of allergic reaction to SubstanceClass, Penicillins.
 - The molecule of the prescribing item BenPen Powder for injection (Powder for injection) 600 mg (solv. req'd) [1], belongs to the substance class of Benzylpenicillin sodium.

No warnings appear when adding a medication to a patient's current medications (using the 'MIMS New' button) or when using the 'MIMS Browse' function.
